

About Us

Sheffield-based Additive Automations is automating the post-processing of additive manufacturing. Currently the process is done manually, but it's laborious, error-prone and toxic.

Programming robots and other industrial equipment for manufacturing is traditionally a hard task that requires experienced technicians and automation engineers. At Additive Automations we're building software applications that move a significant part of the design, programming, debugging and testing process to a virtual 3D environment. Our applications are built on top of the open-source robotics stack, ROS.

This is a unique opportunity to be part of a greenfield development effort that will change the way companies build and produce products. We've just received a significant amount of funding and will be hiring multiple engineers in the coming months, to add to our current team of 6.

About this Job

- Take full ownership of our stack
- You will be working with linux, docker, github (incl. CI) and our suite of automated tests
- Design our stack architecture for industries where cyber-security is safety critical

Requirements

- Proficient in C++
- Degree in Computer Science, Engineering, Mathematics or Physics
- At least 6 years industry experience developing commercial software products
- Excellent understanding of data structures
- BONUS: Experience with cloud/web services deployment/maintenance

Benefits

- The team is located in Sheffield, UK. A hidden gem in the centre of the UK - just ask all the university students that end up never leaving! World class rock climbing, mountain/road biking, trail running, hiking, kayaking, award winning craft beer, boutique coffee roasters and some of the best pub food in the world
- The role is for a permanent position
- Flexible working hours and some remote working available
- 33 days holiday including bank holidays
- Share options
